

Day 1: Four 4's

Text by Professor Jo Boaler

Introduction

In day 1 we have a video and 2 activities. The first activity helps students work well in groups all year, the second is one of my favourite inquiry tasks that helps to set norms on the first day of the year. The timing for the lesson is given after my description of the tasks.

Video

The messages of the video are that everyone can learn maths, with important brain and mindset evidence that will encourage students in maths. It will be good if you have time to discuss the video, after the video or at the end of the lesson. Or you could ask the students to reflect on the ideas in writing later.

Activity: Good Group Work

I always use this activity before students work on maths together as it helps improve group interactions. Teachers who have tried this activity have been pleased by students' thoughtful responses and found the students' thoughts and words helpful in creating a positive and supportive environment. First I ask students to reflect on things they don't like people to say or do in a group when they are working on maths together. Students come up with quite a few really important ideas, such as not liking people to give away the answer, or to rush through the work, or to ignore other people's ideas. After they have thought of a few of the ideas I ask them to think of the converse – what DO they like people to do and say when working in a group. When students have had enough time in groups brainstorming the teacher then collects the ideas. I usually do this by making a “What we don't like” list/poster and asking each group to contribute one idea, moving around the room until a few good ideas have been shared (usually about 10). Then I do the same for the “what we do like” poster/list. I usually present the final posters to the class as our agreed upon classroom norms that we will refer back to through the year. If any student shares a negative comment, such as “I don't like waiting for slow people” do not put it on the poster, instead use it as a chance to discuss the issue. This rarely or never happens and students are usually very thoughtful and respectful in the ideas they share.

Activity: Four 4's

I chose four 4's as a first day activity as it is exciting and engaging for students and it also provides a gentle way to encourage reluctant students to come to the board to share their thinking. I always start the activity by putting the numbers 1 to 20 on the board with plenty of space in between them:

Write the numbers 1 - 20 on the board so students can share their solutions.

1.	6.	11.	16.
2.	7.	12.	17.
3.	8.	13.	18.
4.	9.	14.	19.
5.	10.	15.	20.

Ask students to include as many examples as they can think of for each solution.

Day 1: Four 4's

I then tell students we are going to try and find every number from 1 to 20 using only four 4's – all four of them have to be used each time – and any operation.

I ask them to think of operations and together we make a list. Usually they come up with:

$$+ \quad - \quad \times \quad \div$$

Sometimes I add in the square root of 4, if students don't think of it. You could choose to share one example solution, such as:

$$\sqrt{4} + \frac{4}{4} + 4$$

Organise the students into groups. The finding of individual solutions is not a very “group worthy” task and students often like to work alone in thinking about them, but it is nice if they are sitting in groups so they can bounce ideas off each other and talk.

I tell students to put on the board as many solutions they can think of for each number, and to come and put their solution up on the board whenever they think of one.

If a student puts up an incorrect solution do not correct it, wait as students will often see it for themselves, as more solutions are shared.

When I last taught four 4's with Year 7 they managed to find all of the numbers except 11, 13 and 19. At that point, a nice teach-able moment, I shared with students the meaning of the factorial operation. They were excited to learn this and immediately put it to good use as they saw that it allowed them to find the “missing” numbers.

Factorial

$$2! = 2 \times 1 = 2$$
$$3! = 3 \times 2 \times 1 = 6$$
$$4! = 4 \times 3 \times 2 \times 1 = 24$$

This activity has many extensions. If students have found the 20 numbers and you have more lesson time, ask them if they can think of other questions to try. Or pose other questions, such as, extending beyond 20, extending into negative numbers, or five 5's.

Day 1: Four 4's

Activity	Time	Description/Prompt	Materials
Day 1 Video: Mindset	4 min	Video https://www.youcubed.org/wim-day-1/	
		Possible video discussion	
Good Group Work	15 min	<ol style="list-style-type: none"> 1. Reflect on the things you do not like people to say and do when you are working on maths in a group 2. Reflect on the things you do like people to say and do when you are working on maths in a group 	<ul style="list-style-type: none"> • Paper, pencil/pen • 2-4 pieces of large poster paper to collect the students' ideas
Four 4's	20 min	Find the numbers 1 - 20 using only four 4's and any operation. Students work in groups and come up to the board to share solutions whenever they find them.	<ul style="list-style-type: none"> • Paper, pencil/pen
Closing	5 min	Review the key concepts: Having a growth mindset for mathematics is important. We can all learn maths to any level we choose. Self belief is really important.	

Extensions:

- Can you continue using Four 4's to find numbers greater than 20?
- Make a number challenge of your own that is similar to Four 4's
- Can you use Four 4's to make negative numbers?
- How many numbers can you make with Five 5's?
